

## Western Graphtec Legacy

Western Graphtec developed premier linear chart recorders, pen oscillographs, and thermal array coders that provided paper records for electronic signals in both data acquisition and signal analysis. Graphtec's legacy chart recorders were considered leading recorders that carried paper options for oscilloscopes carrying 0Hz to 10Khz signals. Application varied from sound, vibration, phase shifts, velocity, acceleration, brain waves, magnetic force, and even animal heart beats.

Carrying military-grade precision and performance that matched leading electronic testing products of the day, Graphtec's WR linear chart recorders and WX X-Y recorders have proven to offer the data that industry professionals trust day in and day out. Many of these products are still being used fully in line in aerospace, medical, and military applications. Some are used to secure your next flight with strain testing for airplane wings. Others are used to secure the smoothness of the catheter that goes into your body.

The strength of the precision and the guiding principals behind Western Graphtec can still be seen in the new line-up of dataloggers and data acquisition platforms that carries our company to this day. Key elements of that principals are:

- Channel to Channel Isolation for accurate trust-worthy data for multi-channel applications.
- Precision High Speed Dynamic Signal Recording
- Easy to access Data Records
- Simultaneous and Real Time display and Storage

Graphtec GL series of standalone dataloggers can be a great replacement with a digital-based system that provides handy, easy-to-access records that are just as reliable and much more precise .
